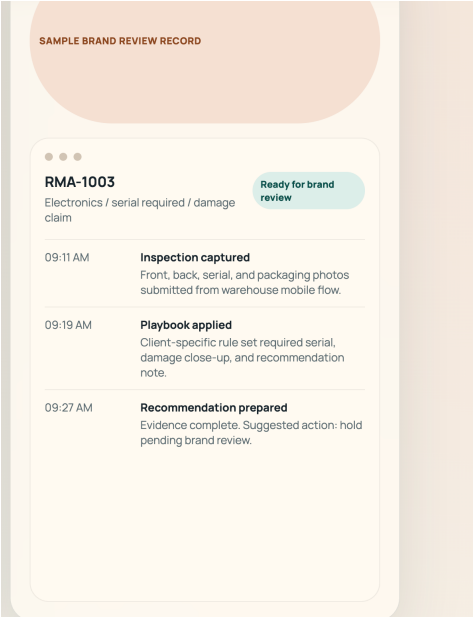
Brand-ready return evidence

Defensible return evidence, generated on the warehouse floor.

Customer Edition - Updated April 13, 2026. Built for multi-brand warehouse teams that need client playbooks, close-up proof, and one clean review record.



Dossentry is a warehouse-side exception-control layer for returns. It helps warehouse teams inspect on phones, apply the right brand rules, review cases in one queue, and send a Brand Review Link instead of rebuilding the story from screenshots and chat threads.

- Phone-first evidence capture
- Brand Review Link
- No station rebuild
- Customer-owned deployment

Client playbooks

Turn each brand's SOP into a live inspection rule set with required proof and allowed actions.

Phone-first inspect

Run scan, evidence capture, and inspection directly from a browser on devices the team already uses.

Decision Queue

Keep disputed or high-risk cases in one operational queue with evidence readiness and audit context.

Brand defense pack

Export a review-ready case pack or send one protected Brand Review Link when the brand asks questions.

Dossentry is strongest in the messy layer after the item is physically back in the warehouse: the point where the team must inspect it correctly, capture the right proof, justify the next action, and explain the case back to the brand if challenged.

Current End-To-End Workflow

1

Set playbooks

Define brand-specific evidence rules, allowed conditions, required photos, and default decision state.

2

Inspect on the floor

Inspectors scan the label, capture close-up proof, and record condition, SKU, serial, and notes.

3

Create the case record

Every inspection becomes a structured case with evidence progress, timeline, and SLA age.

4

Review in queue

Ops filters cases by evidence gaps, age, or brand and moves them through hold, needs review, or ready for brand review.

5

Share one clean record

Send a Brand Review Link or PDF instead of stitching together folders, screenshots, and email context.

Why Warehouse Teams Use Dossentry

- Standardize multi-brand return handling without relying on PDFs, spreadsheets, or chat threads.
- Capture the close-up proof brands actually ask for, including serial labels, packaging damage, and inside-the-box evidence.
- Reduce back-and-forth when a brand questions how a return was handled.
- Block weak cases from moving forward before evidence is complete.
- Keep the current WMS and shopper-facing portal instead of replacing the full stack.
- Start on the devices the team already uses instead of rebuilding warehouse stations.

What Teams Can Do Today

The current product is already organized around warehouse exception handling rather than a generic inspection checklist.

Capability	What It Does	Why It Matters
Client playbooks	Create brand-specific rules for conditions, warehouse actions, required photos, SKU, serial, notes, and default decision state.	Standardizes multi-brand handling without relying on memory or scattered SOPs.
Phone-first inspection	Inspect from a browser with live scan, camera-photo scan fallback, hardware scan, or manual entry.	Lets teams work on the floor without installing fixed stations.
Structured case record	Create a case with evidence status, timeline, notes, SKU, serial, timestamps, and SLA age.	Gives ops one record to review instead of reconstructing the case later.
Decision Queue	Review cases by hold, needs review, or ready for brand review with evidence and aging filters.	Keeps exception handling operational instead of ad hoc.
Brand Review Link	Generate a protected read-only review record with photos, timeline, playbook snapshot, recommendation, and evidence status.	Shortens brand back-and-forth when a return decision is challenged.
Brand defense pack PDF	Open or download a case pack that combines summary, evidence, timeline, and decision context.	Useful for escalations, client communication, and internal review.
Ops Board	Track inspections today, missing evidence, backlog by brand, ready cases, and over-48-hour cases.	Lets managers see throughput and risk without building a new report.
Customer-controlled deployment	Support browser-based use, live demo access, and Docker self-hosted deployment.	Fits operators who want workflow value without a heavy systems migration.

Deployment And Access Model

- Browser-based warehouse workflow
- Live web demo entry point
- Docker self-hosted option
- Customer-controlled data and staff access

Best Fit	Not Trying To Replace
Multi-brand 3PLs, operators serving multiple DTC brands, and warehouse teams that handle high-risk or disputed return cases.	A shopper-facing returns portal, a shipping label or exchange platform, a WMS replacement, or a full reverse logistics suite.
